

## ABSTRACT

To provide a coated leather being excellent in stain  
removability and solvent resistance and having cold resistance and  
5 flexing fatigue resistance equal to those of conventional urethane resin  
coating. A coating film obtained by curing a fluorine-containing resin  
coating composition comprising a fluorine-containing resin having a  
reactive curable group and a curing agent is formed as an outermost  
layer directly on the leather or through a primer layer.
